

143A: Principles of Operating Systems

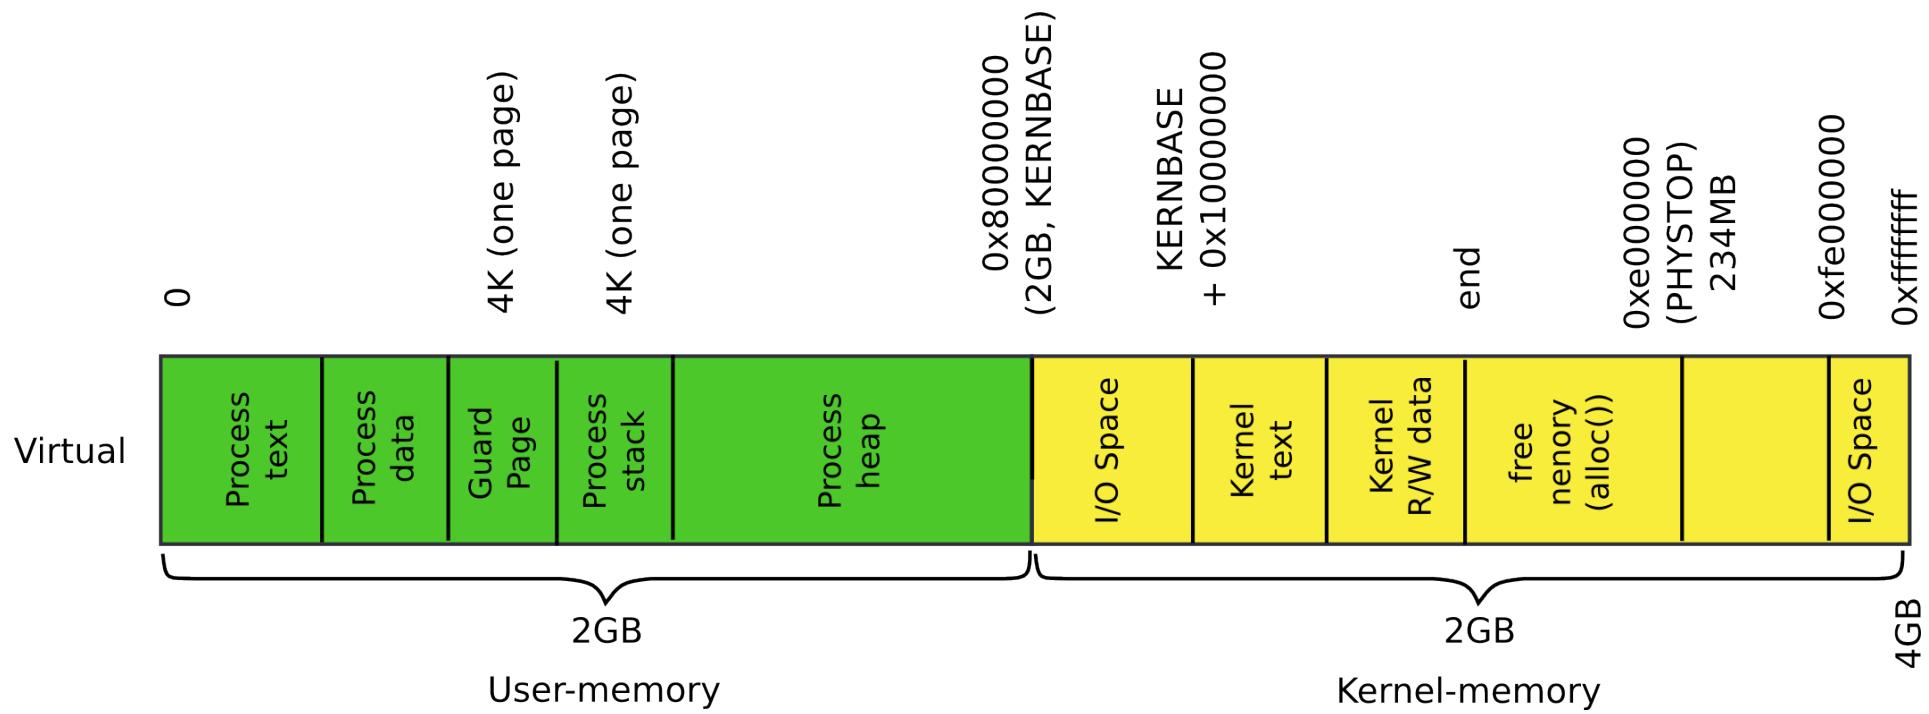

Lecture 11: Creating Processes

Anton Burtsev
October, 2017

Recap: kernel memory

Today: process memory

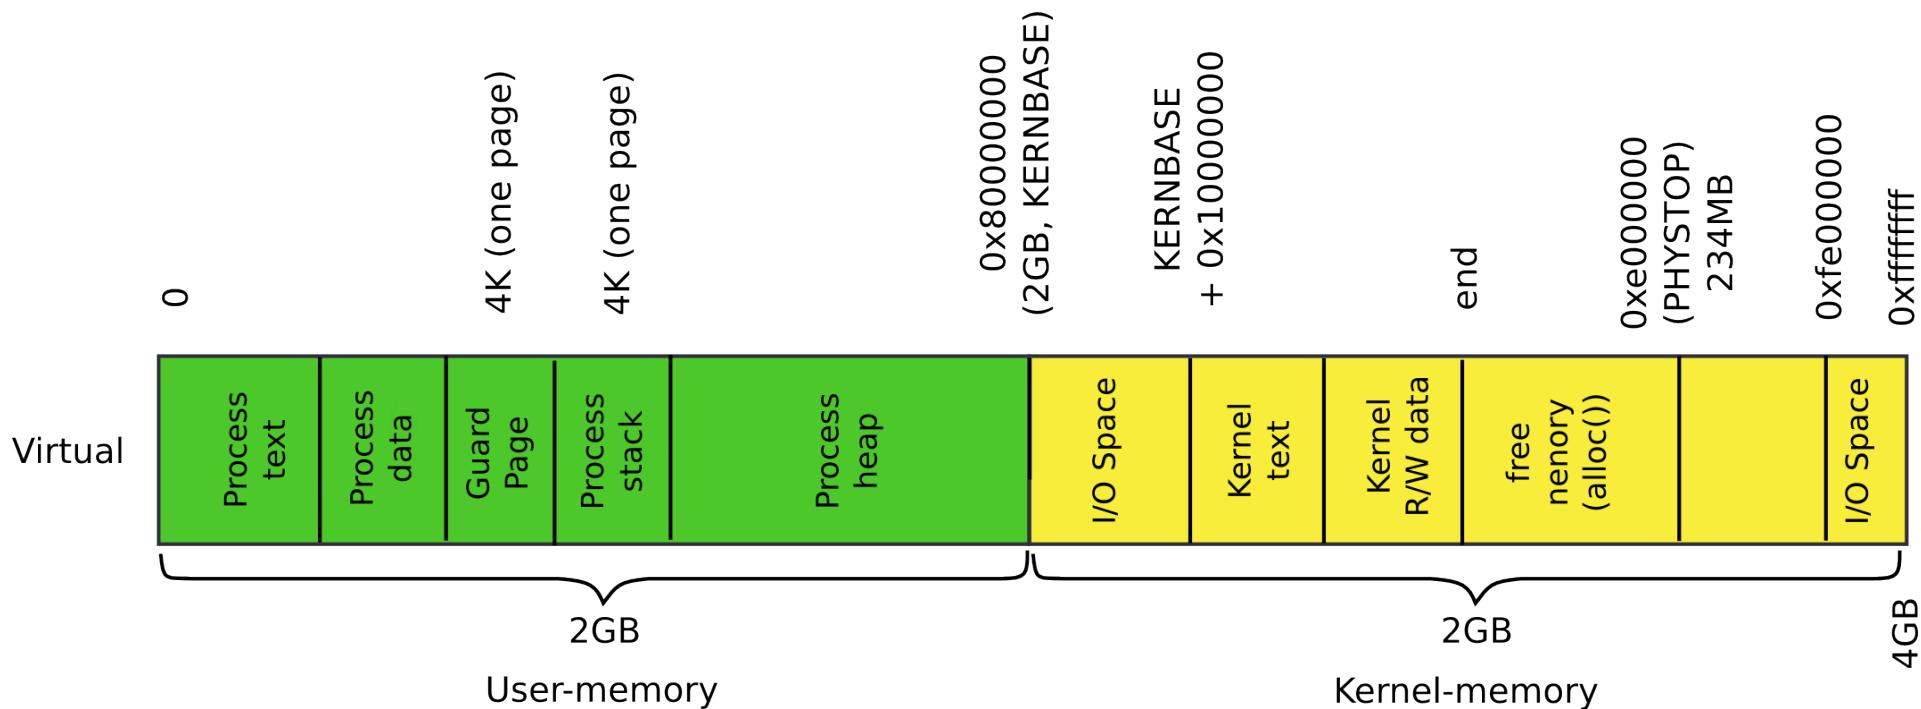

How does kernel creates new processes?

How does kernel creates new processes?

- Exec
 - `exec("/bin/ls", argv);`

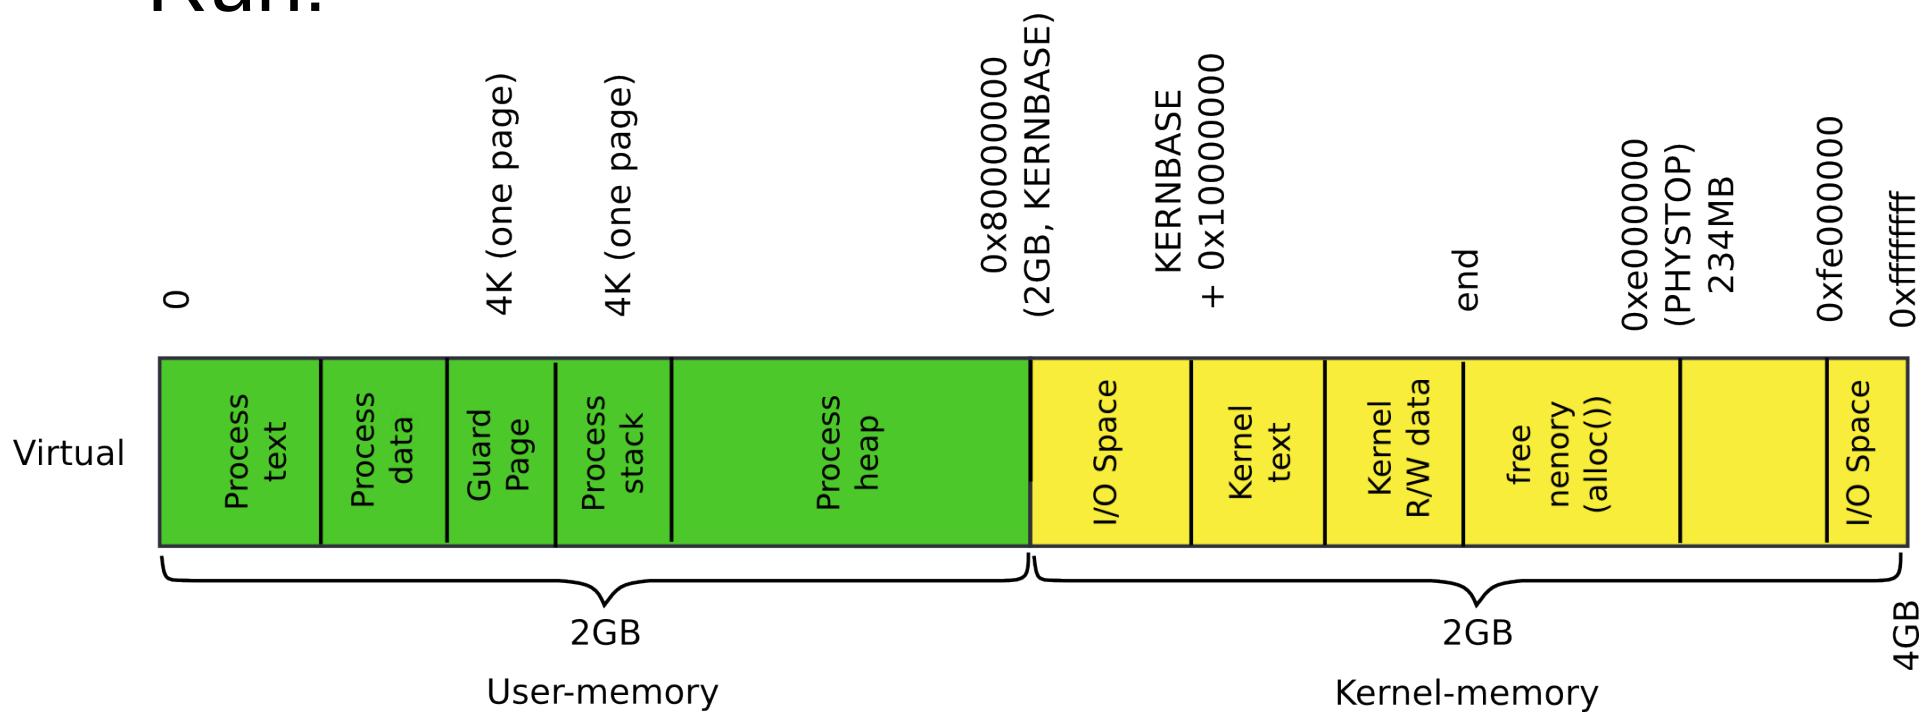

exec(): high-level outline

- We want to create the following layout
 - What shall we do?

exec(): high-level outline

- Load program from disk
- Create user-stack
- Run!

exec(): locate inode

```
6309 int
6310 exec(char *path, char **argv)
6311 {
...
6321     if((ip = namei(path)) == 0){
6322         end_op();
6323         return -1;
6324     }
6328     // Check ELF header
6329     if(readi(ip, (char*)&elf, 0, sizeof(elf)) <
6330         sizeof(elf))
6331         goto bad;
6331     if(elf.magic != ELF_MAGIC)
6332         goto bad;
```

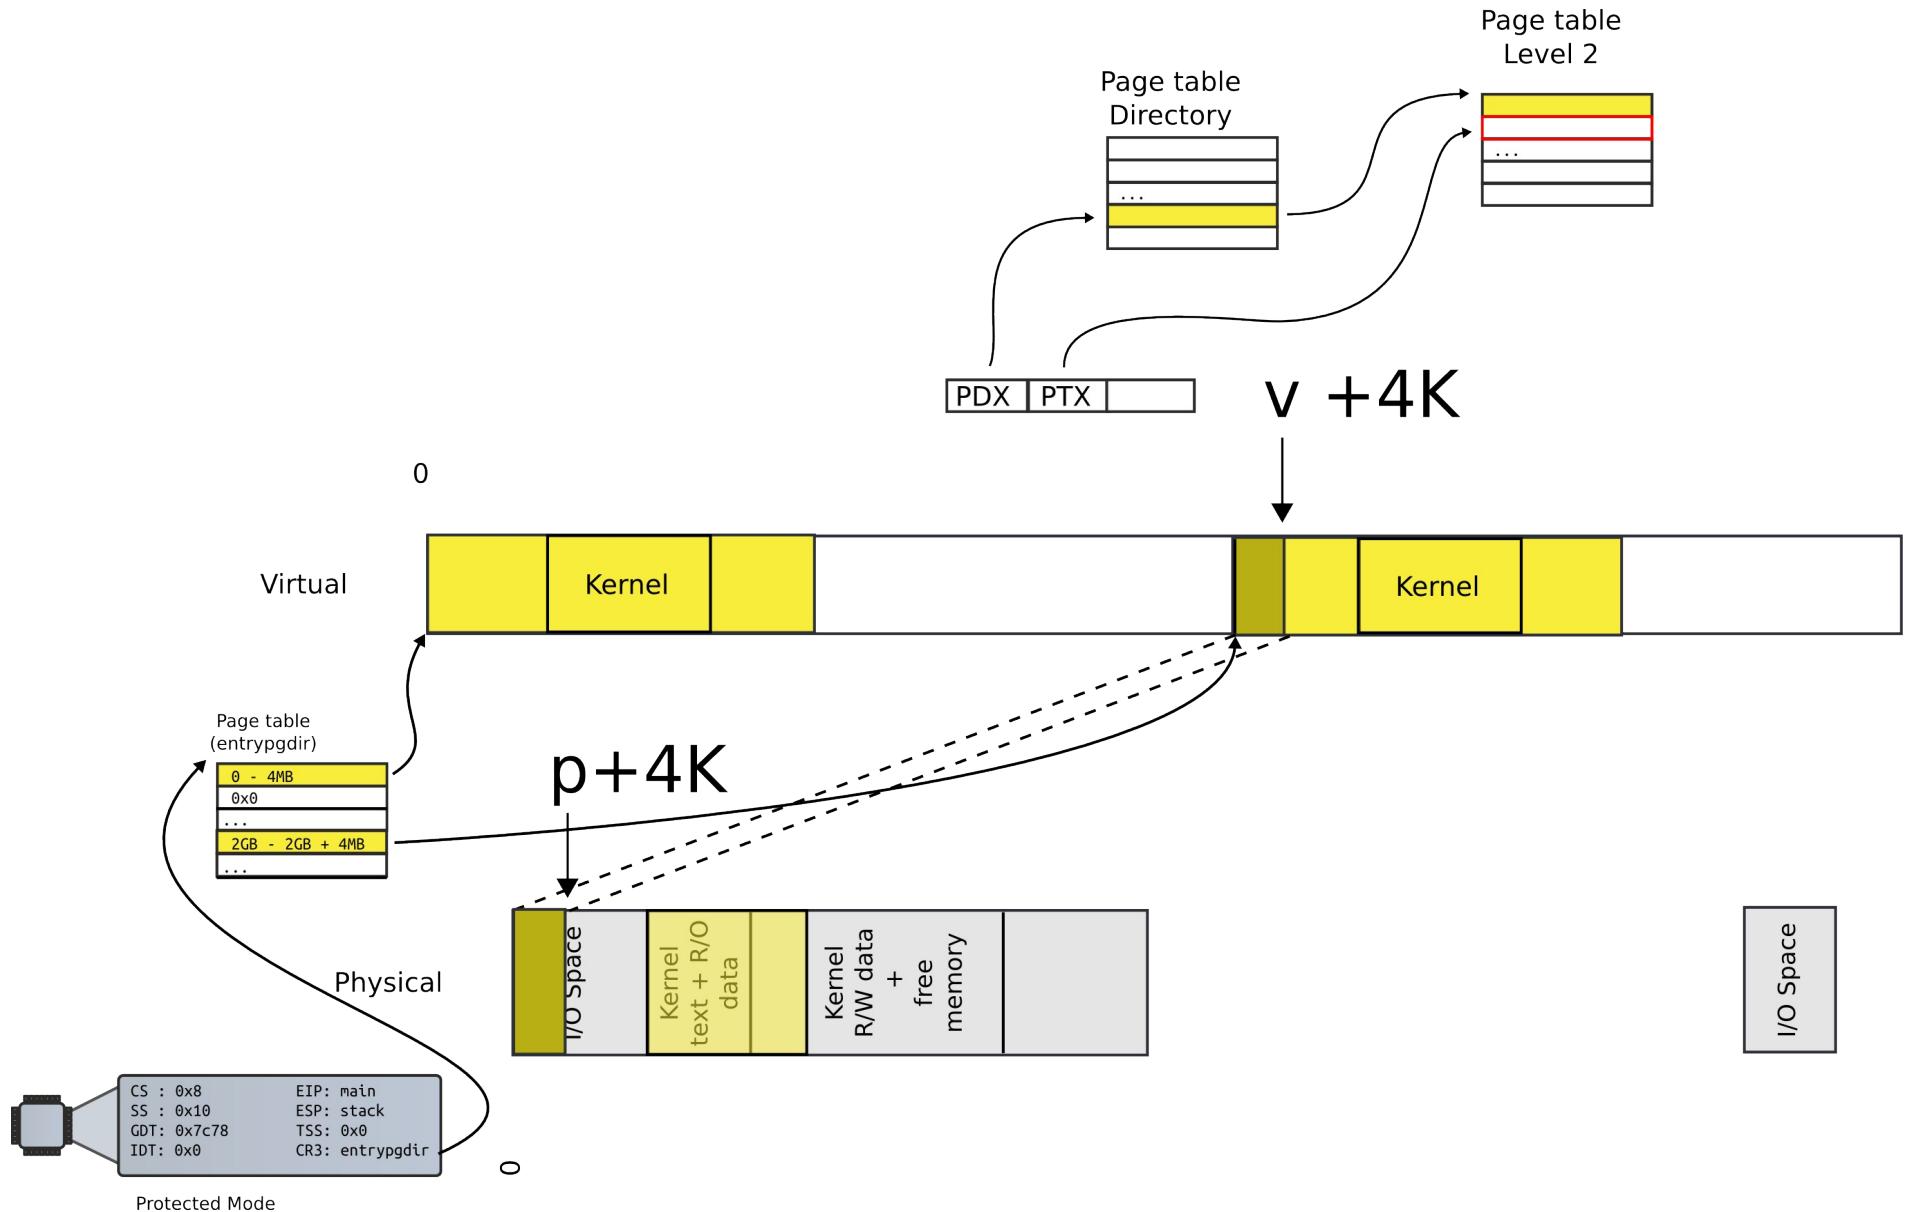

exec(): check ELF header

```
6309 int
6310 exec(char *path, char **argv)
6311 {
...
6321     if((ip = namei(path)) == 0){
6322         end_op();
6323         return -1;
6324     }
6328     // Check ELF header
6329     if(readi(ip, (char*)&elf, 0, sizeof(elf)) <
6330         sizeof(elf))
6331         goto bad;
6331     if(elf.magic != ELF_MAGIC)
6332         goto bad;
```

Exec(): Setup kernel address space()

```
6331     if(elf.magic != ELF_MAGIC)  
6332         goto bad;  
6333  
6334     if((pgdir = setupkvm()) == 0)  
6335         goto bad;  
6336     • Remember from last time?
```

setupkvm(): Move to next page

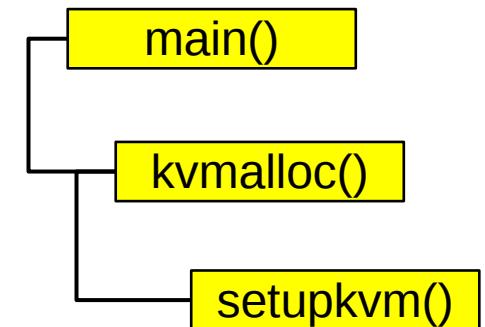

```

1836 pde_t*
1837 setupkvm(void)
1838 {
1839     pde_t *pgdir;
1840     struct kmap *k;
1841
1842     if((pgdir = (pde_t*)kalloc()) == 0)
1843         return 0;
1844     memset(pgdir, 0, PGSIZE);
...
1847     for(k = kmap; k < &kmap[NELEM(kmap)]; k++)
1848         if(mappages(pgdir, k->virt, k->phys_end - k->phys_start,
1849                     (uint)k->phys_start, k->perm) < 0)
1850             return 0;
1851     return pgdir;
1852 }

```

Allocate page table directory

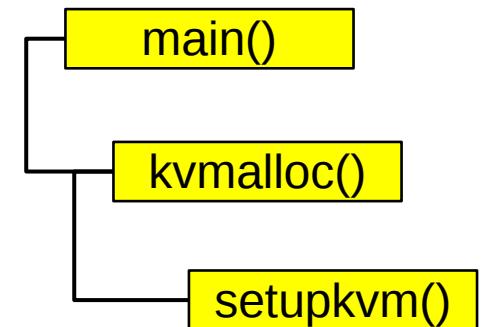

```

1836 pde_t*
1887 setupkvm(void)
1838 {
1839     pde_t *pgdir;
1840     struct kmap *k;
1841
1842     if((pgdir = (pde_t*)kalloc()) == 0)
1843         return 0;
1844     memset(pgdir, 0, PGSIZE);
...
1847     for(k = kmap; k < &kmap[NELEM(kmap)]; k++)
1848         if(mappages(pgdir, k->virt, k->phys_end - k->phys_start,
1849                     (uint)k->phys_start, k->perm) < 0)
1850             return 0;
1851     return pgdir;
1852 }

```

Iterate in a loop: remap physical pages

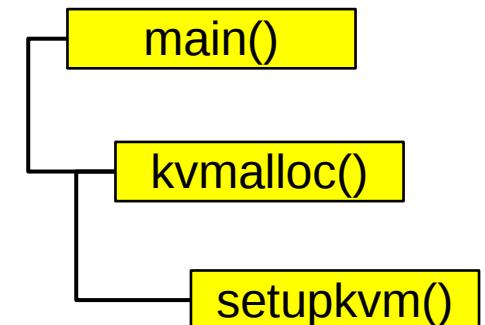

```

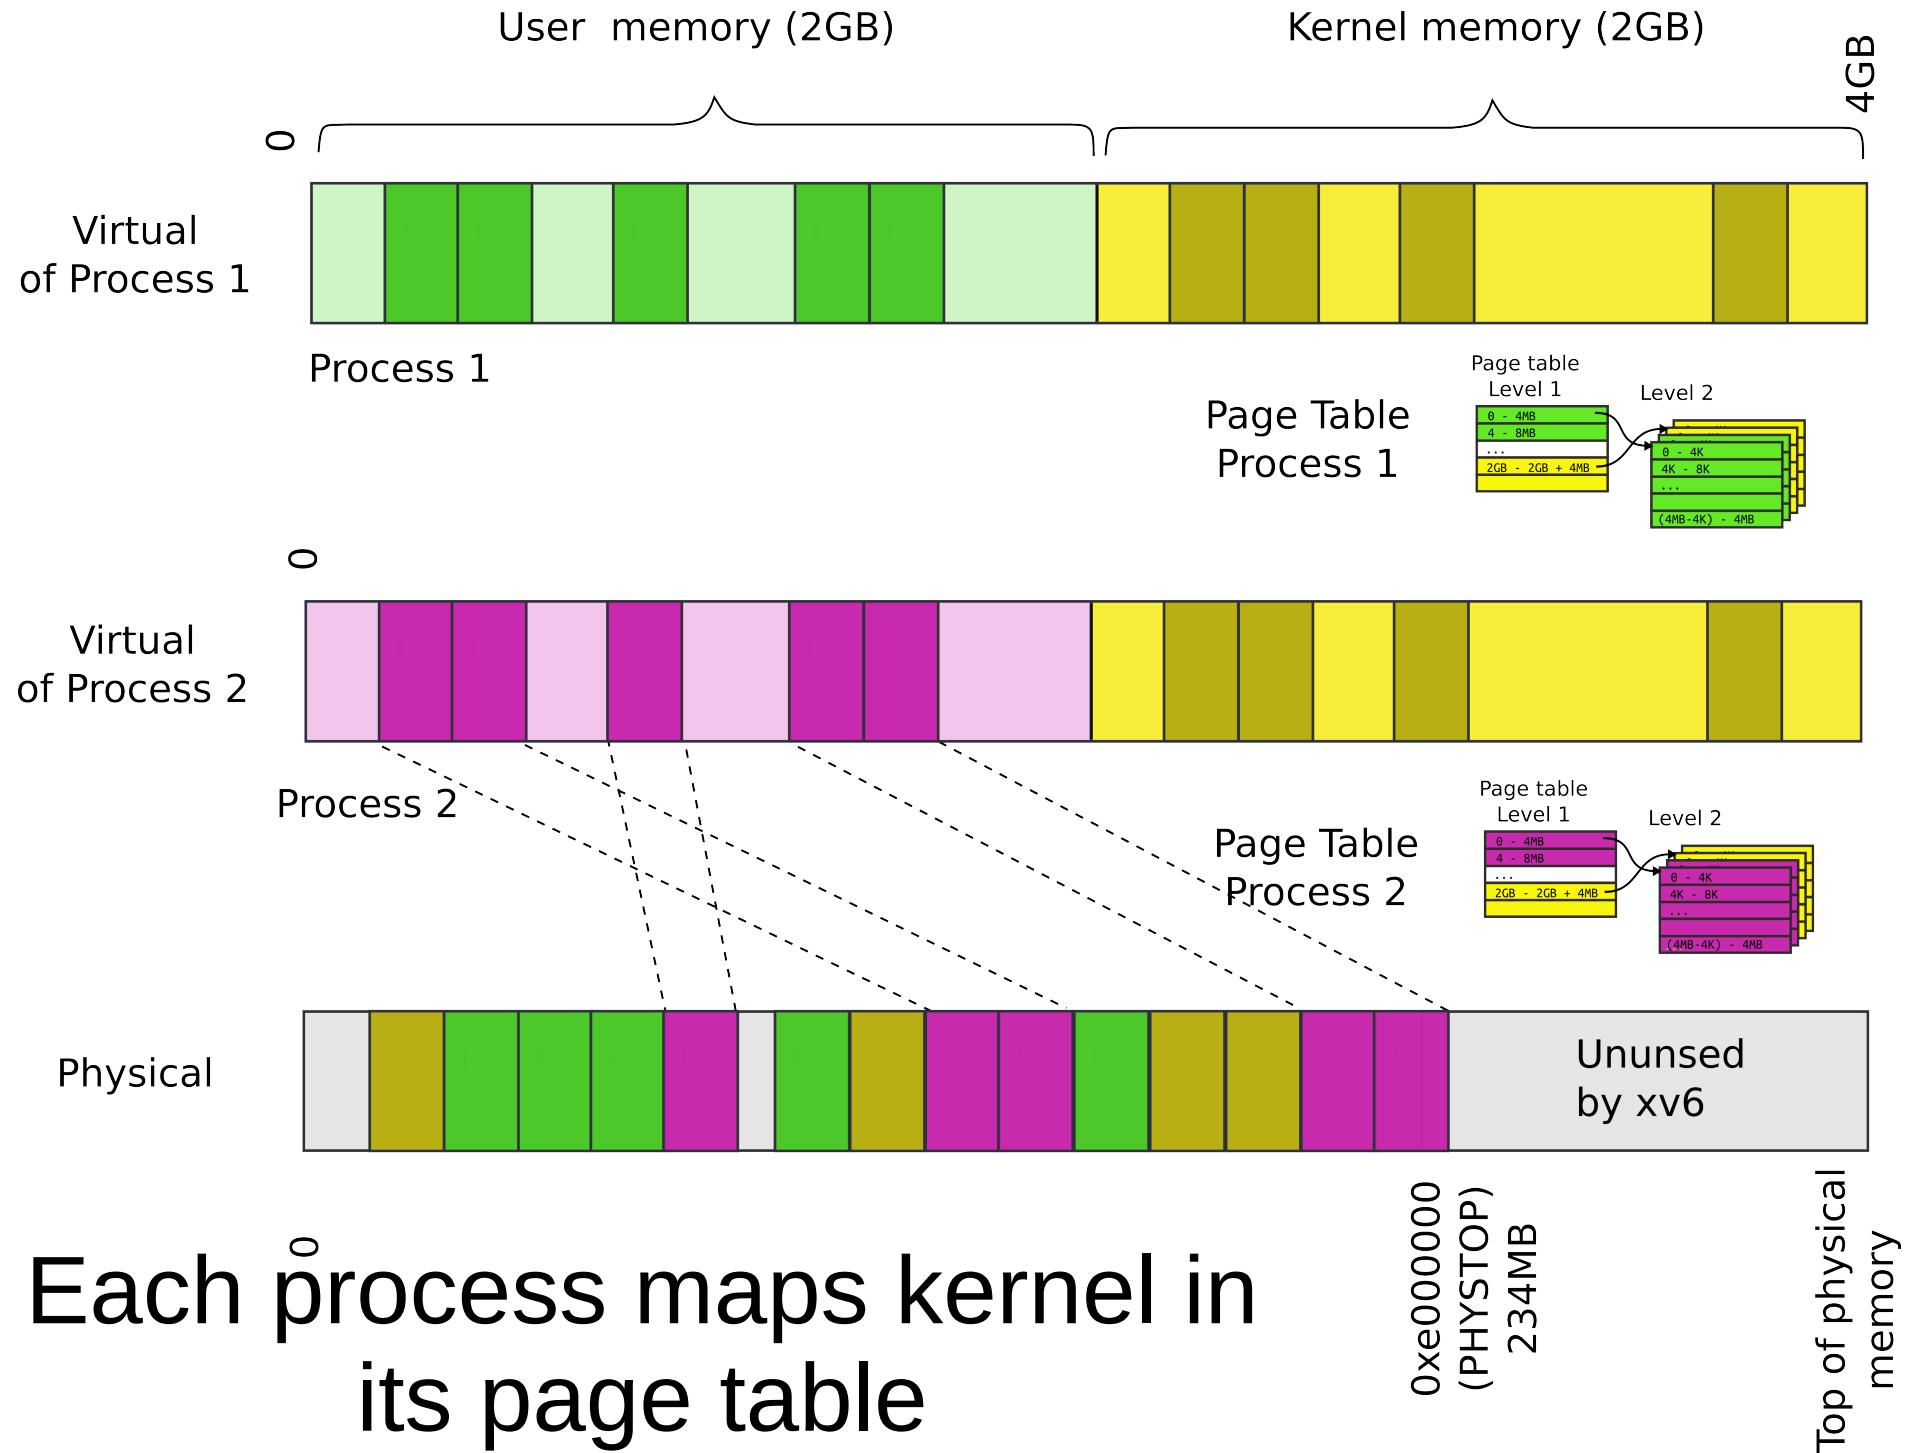

1836 pde_t*
1887 setupkvm(void)
1838 {
1839     pde_t *pgdir;
1840     struct kmap *k;
1841
1842     if((pgdir = (pde_t*)kalloc()) == 0)
1843         return 0;
1844     memset(pgdir, 0, PGSIZE);
...
1847     for(k = kmap; k < &kmap[NELEM(kmap)]; k++)
1848         if(mappages(pgdir, k->virt, k->phys_end - k->phys_start,
1849                     (uint)k->phys_start, k->perm) < 0)
1850             return 0;
1851     return pgdir;
1852 }

```

Iterate in a loop: remap physical pages

But why are we doing that?

Setup kernel address space()

6333

6334 if((pgdir = **setupkvm()**) == 0)

6335 goto bad;

6336

- Remember from last time?

```
6337 // Load program into memory.  
6338 sz = 0;  
6339 for(i=0, off=elf.phoff; i<elf.phnum; i++, off+=sizeof(ph)){  
6340     if(readi(ip, (char*)&ph, off, sizeof(ph)) != sizeof(ph))  
6341         goto bad;  
...  
6348     if((sz = allocuvm(pgdир, sz, ph.vaddr + ph.memsz)) == 0)  
6349         goto bad;  
6350     if(ph.vaddr % PGSIZE != 0)  
6351         goto bad;  
6352     if(loaduvm(pgdир, (char*)ph.vaddr, ip, ph.off, ph.filesz)  
< 0)  
6353         goto bad;  
6354 }
```

Load program into memory

- Set the address space size to 0

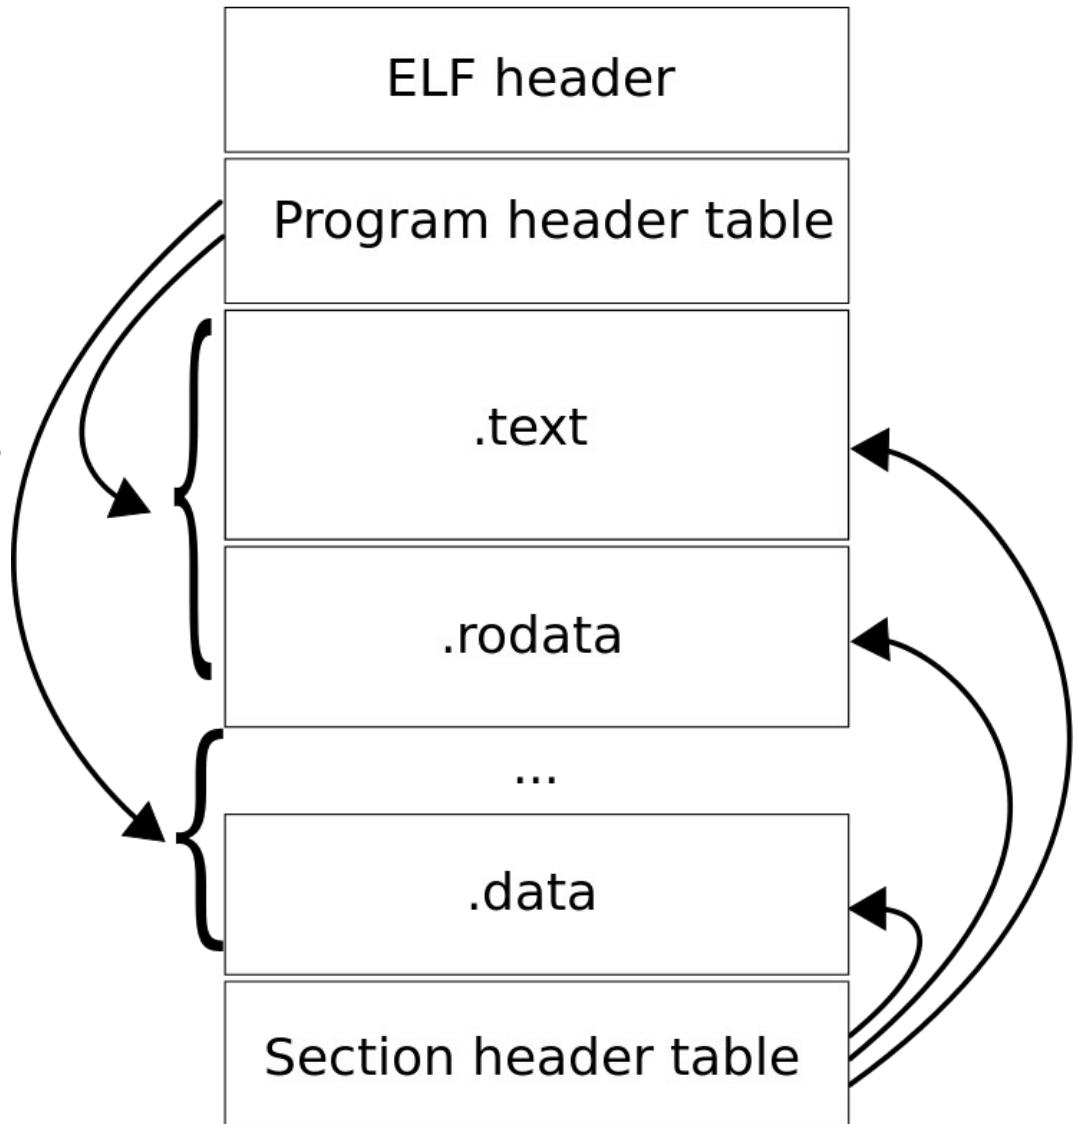

```
6337 // Load program into memory.  
6338 sz = 0;  
6339 for(i=0, off=elf.phoff; i<elf.phnum; i++, off+=sizeof(ph)){  
6340     if(readi(ip, (char*)&ph, off, sizeof(ph)) != sizeof(ph))  
6341         goto bad;  
...  
6348     if((sz = allocuvm(pgdир, sz, ph.vaddr + ph.memsz)) == 0)  
6349         goto bad;  
6350     if(ph.vaddr % PGSIZE != 0)  
6351         goto bad;  
6352     if(loaduvm(pgdир, (char*)ph.vaddr, ip, ph.off, ph.filesz)  
< 0)  
6353         goto bad;  
6354 }
```

Load program into memory

- Loop over all program headers

ELF binary

- ELF header
- Program header table
 - Each entry describes a section of a program
 - Instruction, data

```
6337 // Load program into memory.
```

```
6338 sz = 0;
```

```
6339 for(i=0, off=elf.phoff; i<elf.phnum; i++, off+=sizeof(ph)){
```

```
6340     if(readi(ip, (char*)&ph, off, sizeof(ph)) != sizeof(ph))
```

```
6341         goto bad;
```

```
...
```

```
6348     if((sz = allocuvm(pgdир, sz, ph.vaddr + ph.memsz)) == 0)
```

```
6349         goto bad;
```

```
6350     if(ph.vaddr % PGSIZE != 0)
```

```
6351         goto bad;
```

```
6352     if(loaduvm(pgdир, (char*)ph.vaddr, ip, ph.off, ph.filesz)< 0)
```

```
6353         goto bad;
```

```
6354 }
```

Load program into memory

- Start at the beginning of the program header table
off = elf.phoff

```
6337 // Load program into memory.  
6338 sz = 0;  
6339 for(i=0, off=elf.phoff; i<elf.phnum; i++, off+=sizeof(ph)){  
6340     if(readi(ip, (char*)&ph, off, sizeof(ph)) != sizeof(ph))  
6341         goto bad;  
...  
6348     if((sz = allocuvm(pgdир, sz, ph.vaddr + ph.memsz)) == 0)  
6349         goto bad;  
6350     if(ph.vaddr % PGSIZE != 0)  
6351         goto bad;  
6352     if(loaduvm(pgdир, (char*)ph.vaddr, ip, ph.off, ph.filesz)  
< 0)  
6353         goto bad;  
6354 }
```

Load program into memory

- Read one program header entry at a time

```
6337 // Load program into memory.
```

```
6338 sz = 0;
```

```
6339 for(i=0, off=elf.phoff; i<elf.phnum; i++, off+=sizeof(ph)) {
```

```
6340     if(readi(ip, (char*)&ph, off, sizeof(ph)) != sizeof(ph))
```

```
6341         goto bad;
```

```
...
```

```
6348     if((sz = allocuvm(pgdир, sz, ph.vaddr + ph.memsz)) == 0)
```

```
6349         goto bad;
```

```
6350     if(ph.vaddr % PGSIZE != 0)
```

```
6351         goto bad;
```

```
6352     if(loaduvm(pgdир, (char*)ph.vaddr, ip, ph.off, ph.filesz)
< 0)
```

```
6353         goto bad;
```

```
6354 }
```

Load program into memory

- Read one program header entry at a time
- Each time increment offset (off)

```
6337 // Load program into memory.  
6338 sz = 0;  
6339 for(i=0, off=elf.phoff; i<elf.phnum; i++, off+=sizeof(ph)){  
6340     if(readi(ip, (char*)&ph, off, sizeof(ph)) != sizeof(ph))  
6341         goto bad;  
  
...  
6348     if((sz = allocuvm(pgdир, sz, ph.vaddr + ph.memsz)) == 0)  
6349         goto bad;  
6350     if(ph.vaddr % PGSIZE != 0)  
6351         goto bad;  
6352     if(loaduvm(pgdир, (char*)ph.vaddr, ip, ph.off, ph.filesz)  
< 0)  
6353         goto bad;  
6354 }
```

Load program into memory

- Alloc pages for program section, e.g., text

```
6337 // Load program into memory.
```

```
6338 sz = 0;
```

```
6339 for(i=0, off=elf.phoff; i<elf.phnum; i++, off+=sizeof(ph)){
```

```
6340     if(readi(ip, (char*)&ph, off, sizeof(ph)) != sizeof(ph))
```

```
6341         goto bad;
```

```
...
```

```
6348     if((sz = allocuvm(pgdир, sz, ph.vaddr + ph.memsz)) == 0)
```

```
6349         goto bad;
```

```
6350     if(ph.vaddr % PGSIZE != 0)
```

```
6351         goto bad;
```

```
6352     if(loaduvm(pgdир, (char*)ph.vaddr, ip, ph.off, ph.filesz)< 0)
```

```
6353         goto bad;
```

```
6354 }
```

Load program into memory

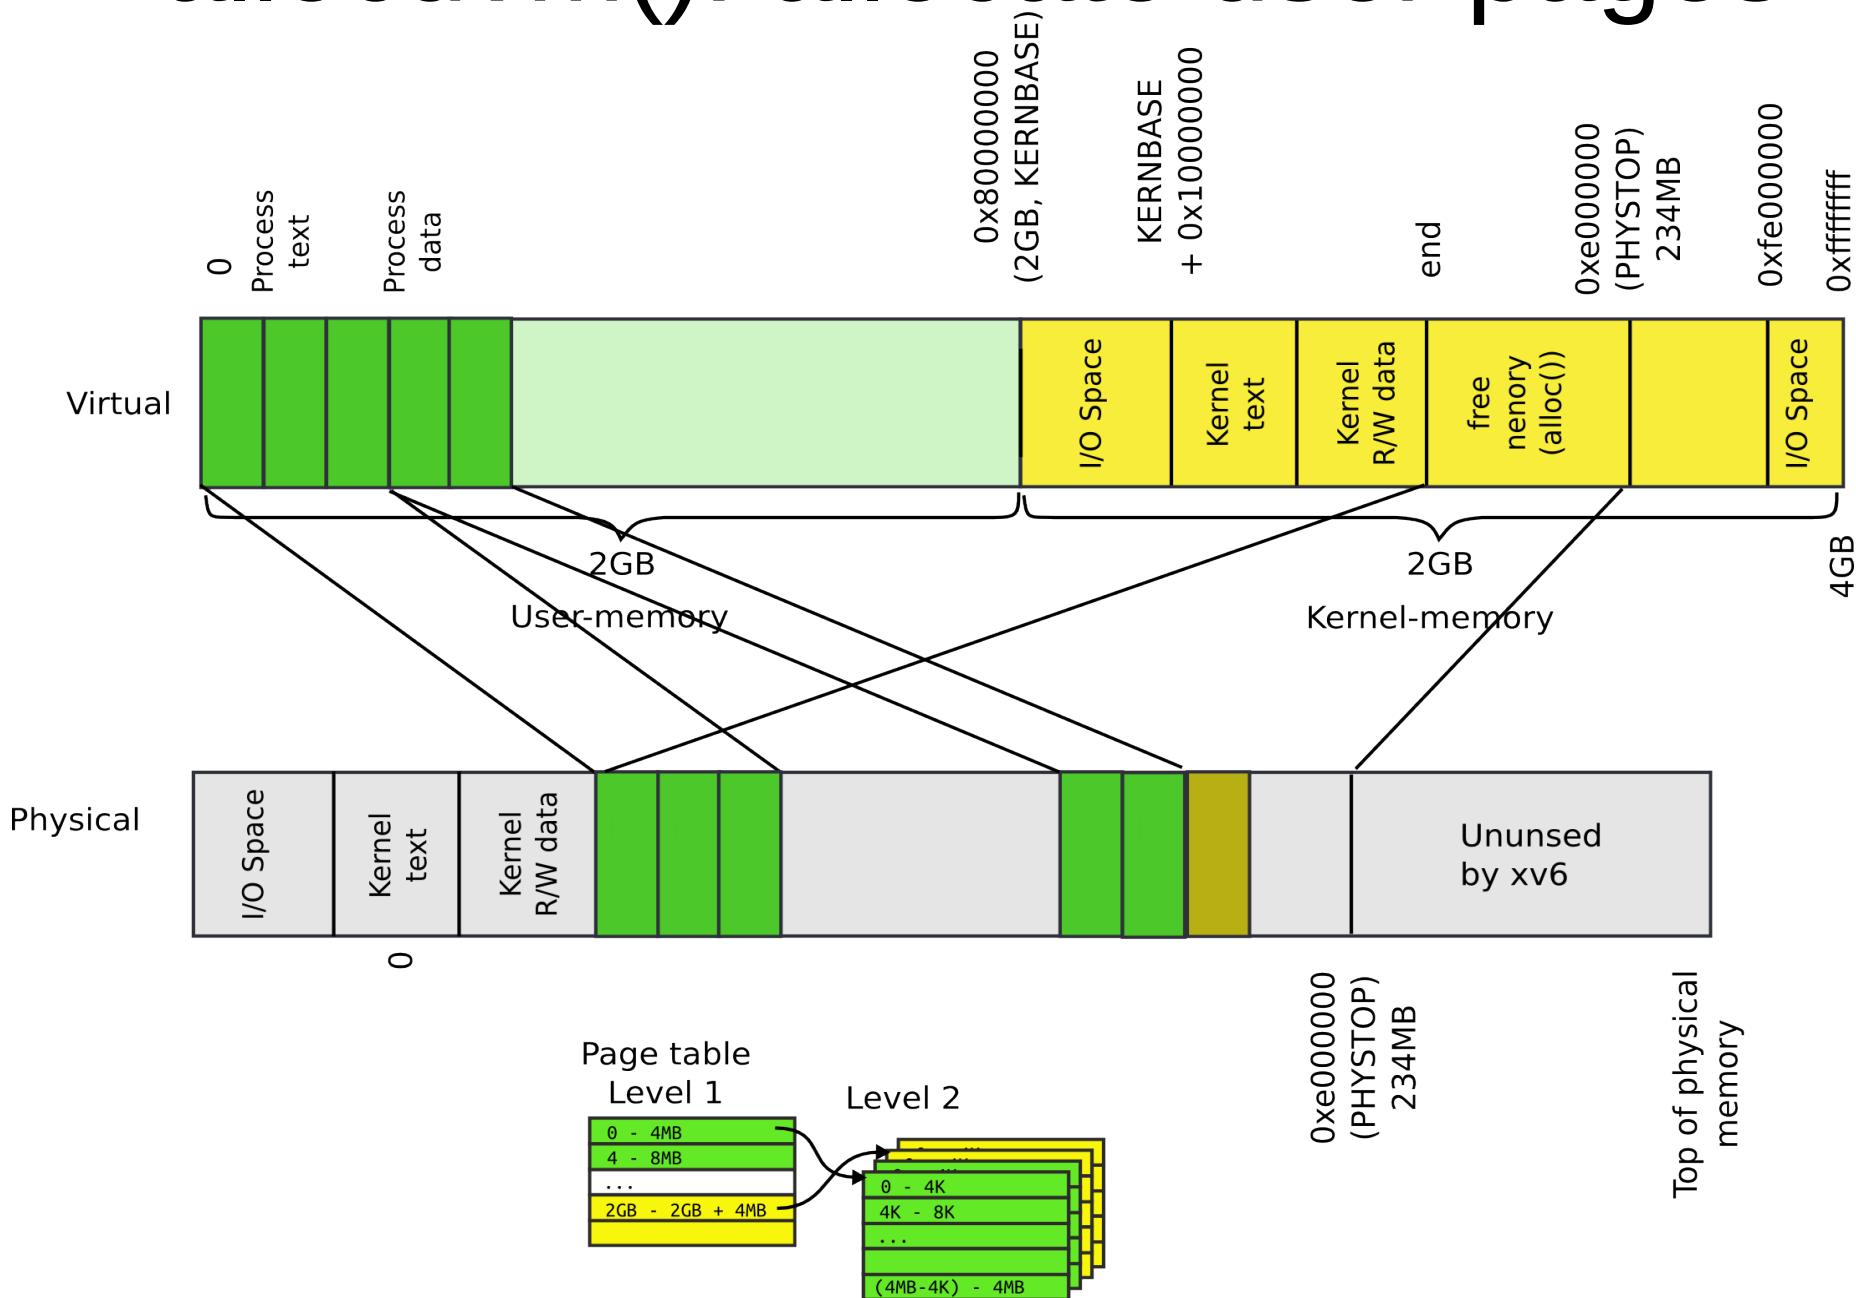

- Size of the user space is initially 0

```
6337 // Load program into memory.  
6338 sz = 0;  
6339 for(i=0, off=elf.phoff; i<elf.phnum; i++, off+=sizeof(ph)){  
6340     if(readi(ip, (char*)&ph, off, sizeof(ph)) != sizeof(ph))  
6341         goto bad;  
  
...  
6348     if((sz = allocuvm(pgdир, sz, ph.vaddr + ph.memsz)) == 0)  
6349         goto bad;  
6350     if(ph.vaddr % PGSIZE != 0)  
6351         goto bad;  
6352     if(loaduvm(pgdир, (char*)ph.vaddr, ip, ph.off, ph.filesz)  
< 0)  
6353         goto bad;  
6354 }
```

Load program into memory

- Allocate memory for user pages
- ph.vaddr is also 0

allocuvm(): allocate user pages

```
1953 allocuvm(pde_t *pgdir, uint oldsz, uint newsz)
1954 {
...
1958     if(newsz >= KERNBASE)
1959         return 0;
...
1964     for(; a < newsz; a += PGSIZE){
1965         mem = kalloc();
...
1971         memset(mem, 0, PGSIZE);
1972         if(mappages(pgdir, (char*)a, PGSIZE, V2P(mem), PTE_W|PTE_U) < 0){
...
1976             return 0;
1977         }
1978     }
1979     return newsz;
1980 }
```

Allocate user pages

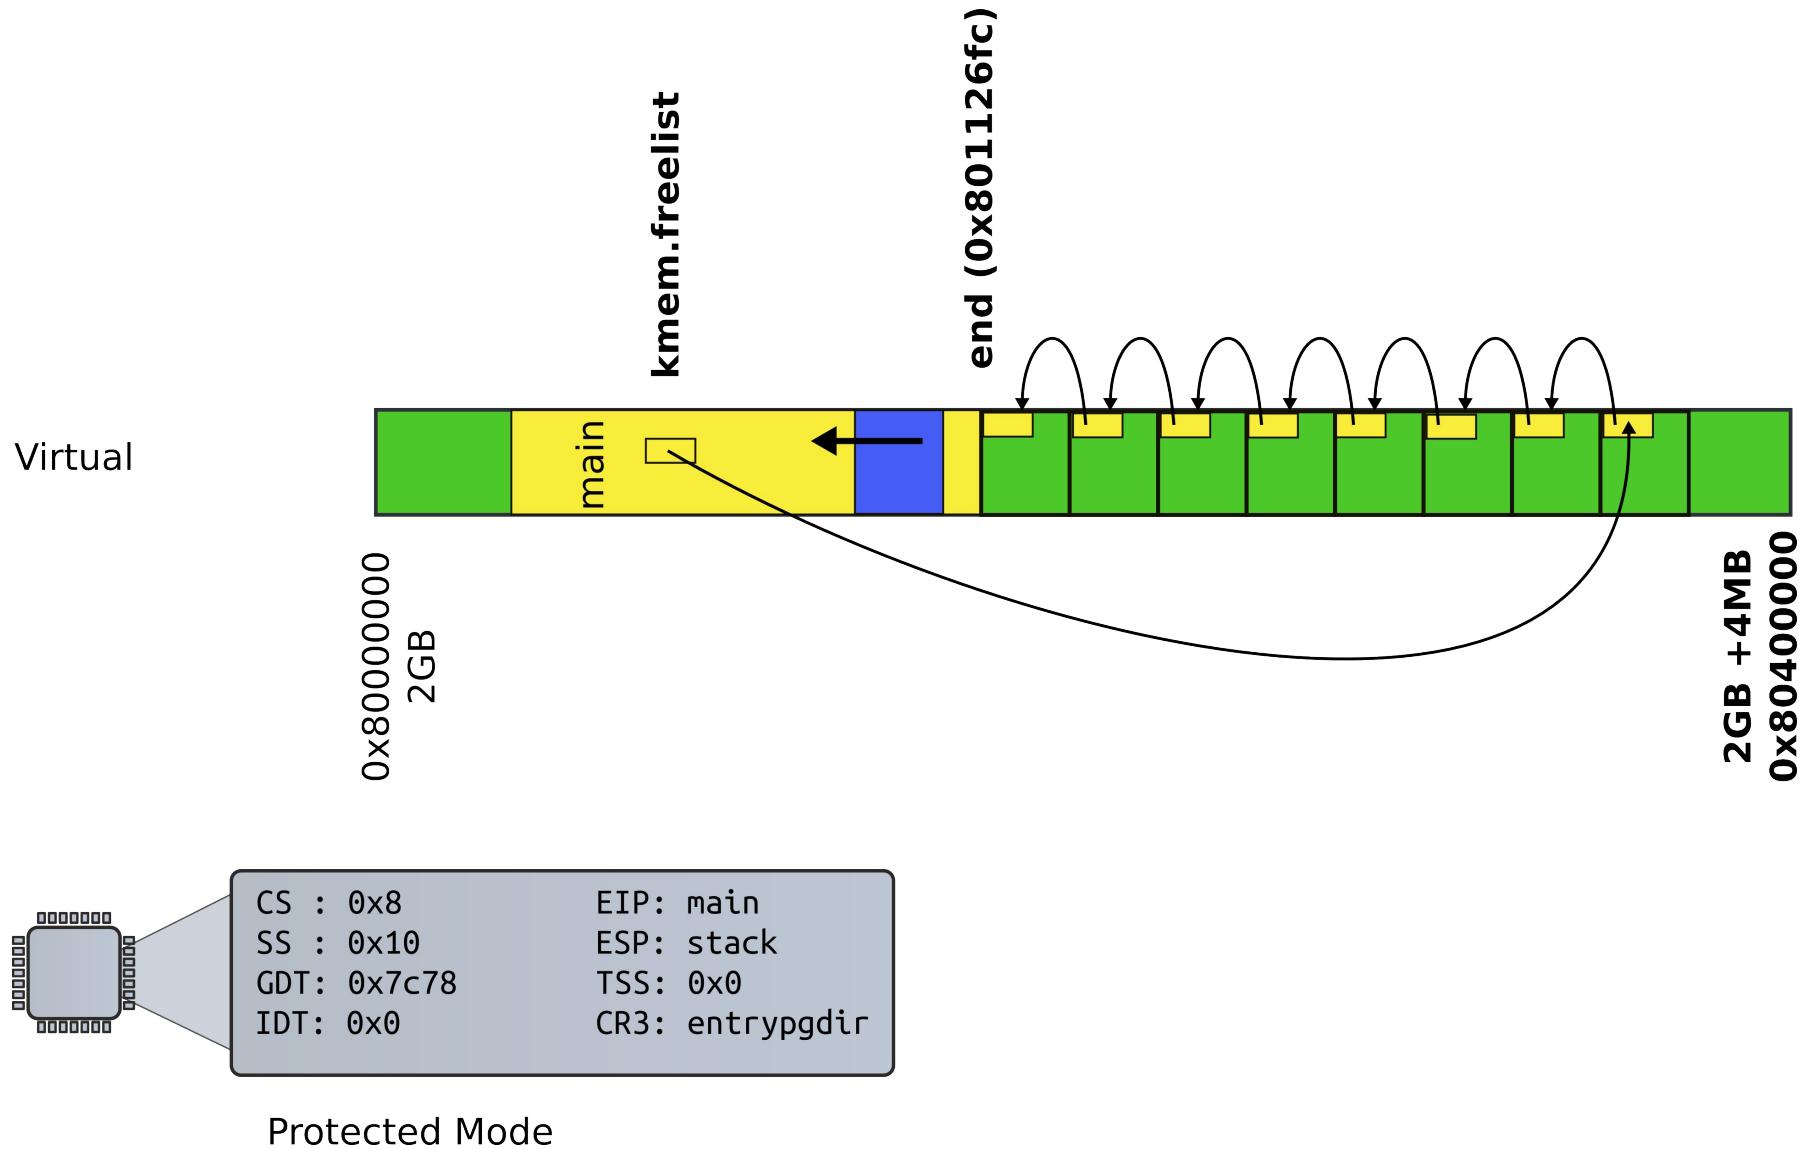

- New size can't be over 2GB

```
1953 allocuvm(pde_t *pgdir, uint oldsz, uint newsz)
1954 {
...
1958     if(newsz >= KERNBASE)
1959         return 0;
...
1964     for(; a < newsz; a += PGSIZE){
1965         mem = kalloc();
...
1971         memset(mem, 0, PGSIZE);
1972         if(mappages(pgdir, (char*)a, PGSIZE, V2P(mem), PTE_W|PTE_U) < 0){
...
1976             return 0;
1977         }
1978     }
1979     return newsz;
1980 }
```

Allocate user pages

- Allocate a page

Kernel memory allocator

```
1953 allocuvm(pde_t *pgdir, uint oldsz, uint newsz)
1954 {
...
1958     if(newsz >= KERNBASE)
1959         return 0;
...
1964     for(; a < newsz; a += PGSIZE){
1965         mem = kalloc();
...
1971         memset(mem, 0, PGSIZE);
1972         if(mappages(pgdir, (char*)a, PGSIZE, V2P(mem), PTE_W|PTE_U) < 0){
...
1976             return 0;
1977         }
1978     }
1979     return newsz;
1980 }
```

Allocate user pages

- Set page to 0

```
1953 allocuvm(pde_t *pgdir, uint oldsz, uint newsz)
1954 {
...
1958     if(newsz >= KERNBASE)
1959         return 0;
...
1964     for(; a < newsz; a += PGSIZE){
1965         mem = kalloc();
...
1971         memset(mem, 0, PGSIZE);
1972         if(mappages(pgdir, (char*)a, PGSIZE, V2P(mem), PTE_W|PTE_U) < 0){
...
1976             return 0;
1977         }
1978     }
1979     return newsz;
1980 }
```

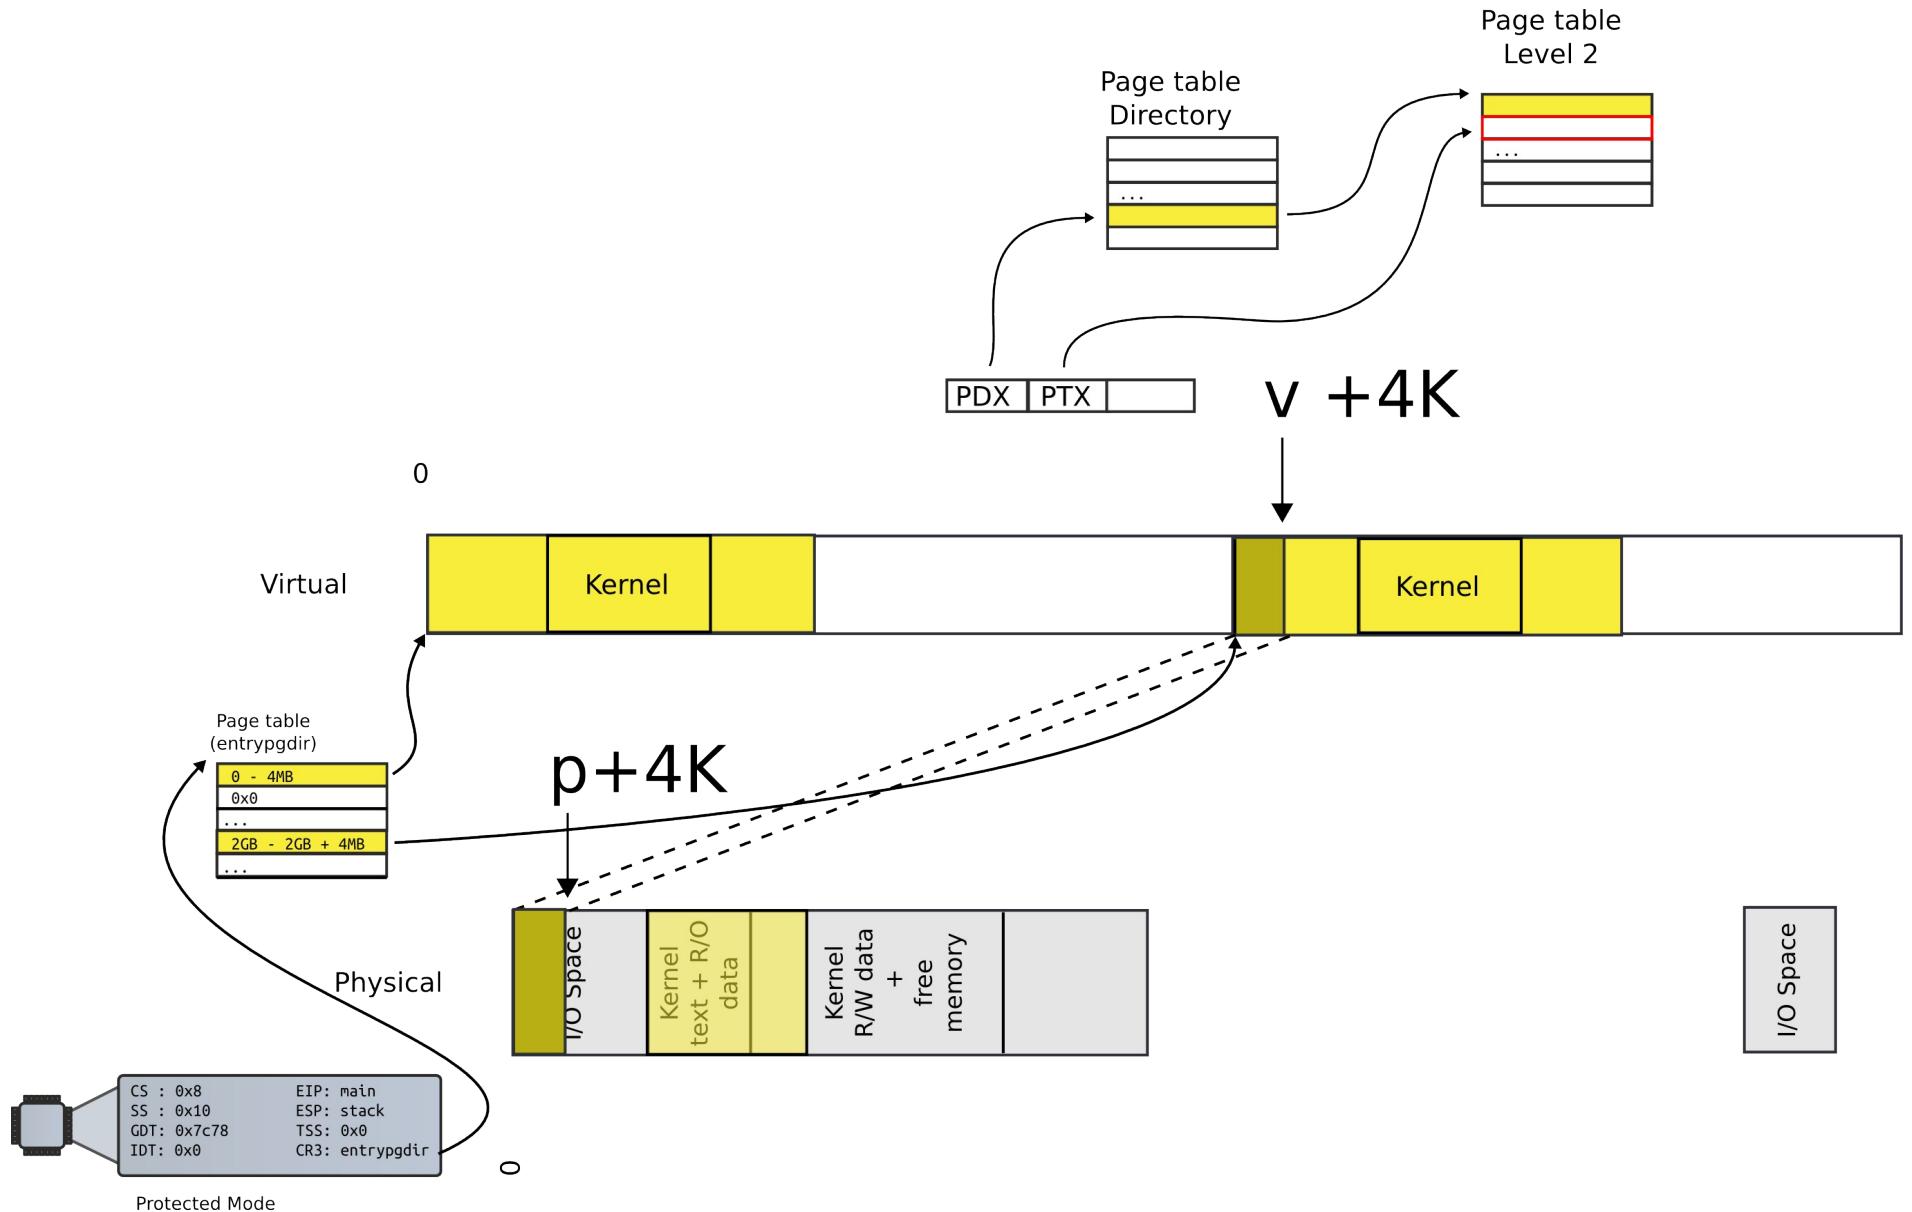

Allocate user pages

- Map the page

Who remembers mappages()?

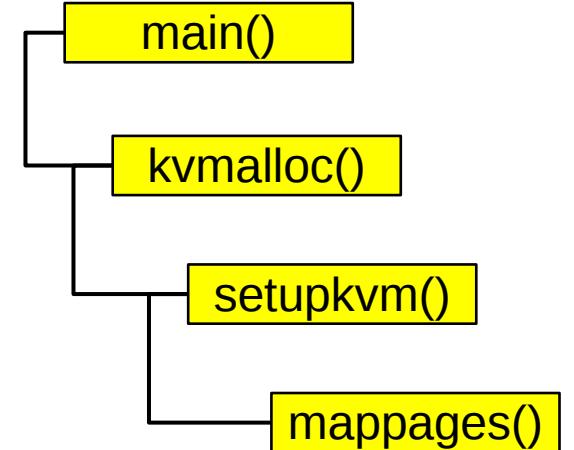

- Remember we want a region of memory to be mapped
 - i.e., appear in the page table

mappages(): map a region

```

1779 mappages(pde_t *pgdir, void *va, uint size, uint pa, int perm)
1780 {
1781     char *a, *last;
1782     pte_t *pte;
1783
1784     a = (char*)PGROUNDDOWN((uint)va);
1785     last = (char*)PGROUNDDOWN(((uint)va) + size - 1);
1786     for(;;){
1787         if((pte = walkpgdir(pgdir, a, 1)) == 0)
1788             return -1;
1789         if(*pte & PTE_P)
1790             panic("remap");
1791         *pte = pa | perm | PTE_P;
1792         if(a == last)
1793             break;
1794         a += PGSIZE;
1795         pa += PGSIZE;
1796     }
1797     return 0;
1798 }
```

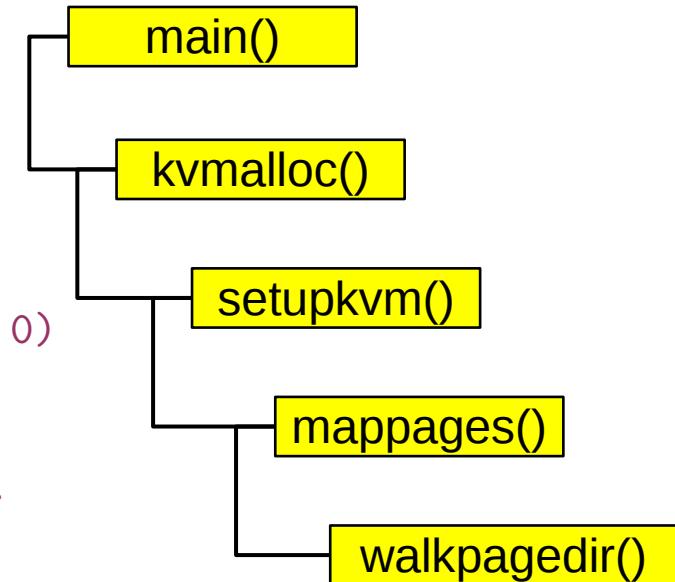

Lookup the page table entry

```

1754 walkpgdir(pde_t *pgdir, const void *va, int alloc)
1755 {
1756     pde_t *pde;
1757     pte_t *pgtab;
1758
1759     pde = &pgdir[PDX(va)];
1760     if(*pde & PTE_P){
1761         pgtab = (pte_t*)P2V(PTE_ADDR(*pde));
1762     } else {
1763         if(!alloc || (pgtab = (pte_t*)kalloc()) == 0)
1764             return 0;
1765         // Make sure all those PTE_P bits are zero.
1766         memset(pgtab, 0, PGSIZE);
...
1770         *pde = V2P(pgtab) | PTE_P | PTE_W | PTE_U;
1771     }
1772     return &pgtab[PTX(va)];
1773 }
```

Walk page table

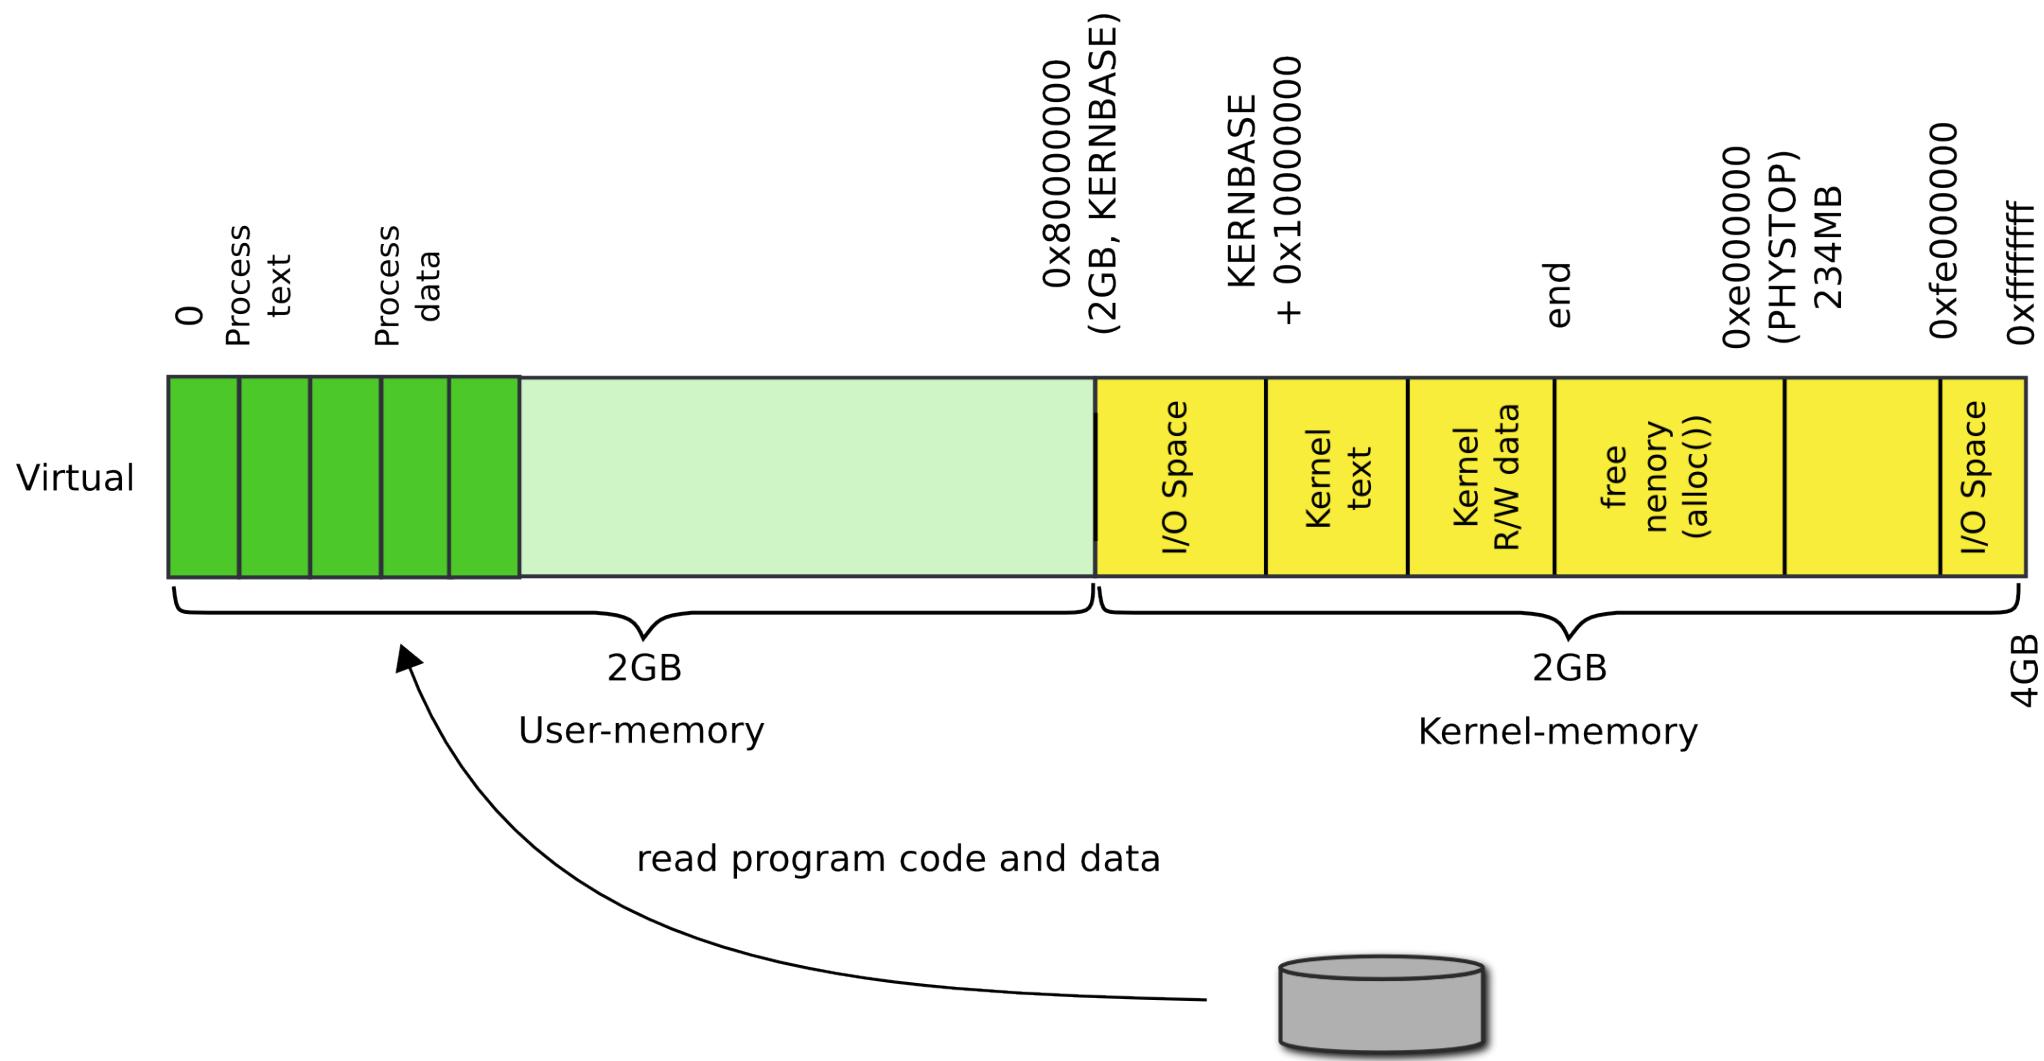

```
6337 // Load program into memory.  
6338 sz = 0;  
6339 for(i=0, off=elf.phoff; i<elf.phnum; i++, off+=sizeof(ph)){  
6340     if(readi(ip, (char*)&ph, off, sizeof(ph)) != sizeof(ph))  
6341         goto bad;  
  
...  
6348     if((sz = allocuvm(pgdир, sz, ph.vaddr + ph.memsz)) == 0)  
6349         goto bad;  
6350     if(ph.vaddr % PGSIZE != 0)  
6351         goto bad;  
6352     if(loaduvm(pgdир, (char*)ph.vaddr, ip, ph.off, ph.filesz)  
< 0)  
6353         goto bad;  
6354 }
```

Load program into memory

- Load program section from disk

loaduvm(): read program from disk

```
1918 loaduvm(pde_t *pgdir, char *addr, struct inode *ip, uint offset, uint
sz)
1919 {
...
1925     for(i = 0; i < sz; i += PGSIZE){
1926         if((pte = walkpgdir(pgdir, addr+i, 0)) == 0)
1927             panic("loaduvm: address should exist");
1928         pa = PTE_ADDR(*pte);
1929         if(sz - i < PGSIZE)
1930             n = sz - i;
1931         else
1932             n = PGSIZE;
1933         if(readi(ip, P2V(pa), offset+i, n) != n)
1934             return -1;
1935     }
1936     return 0;
1937 }
```

Load program into memory

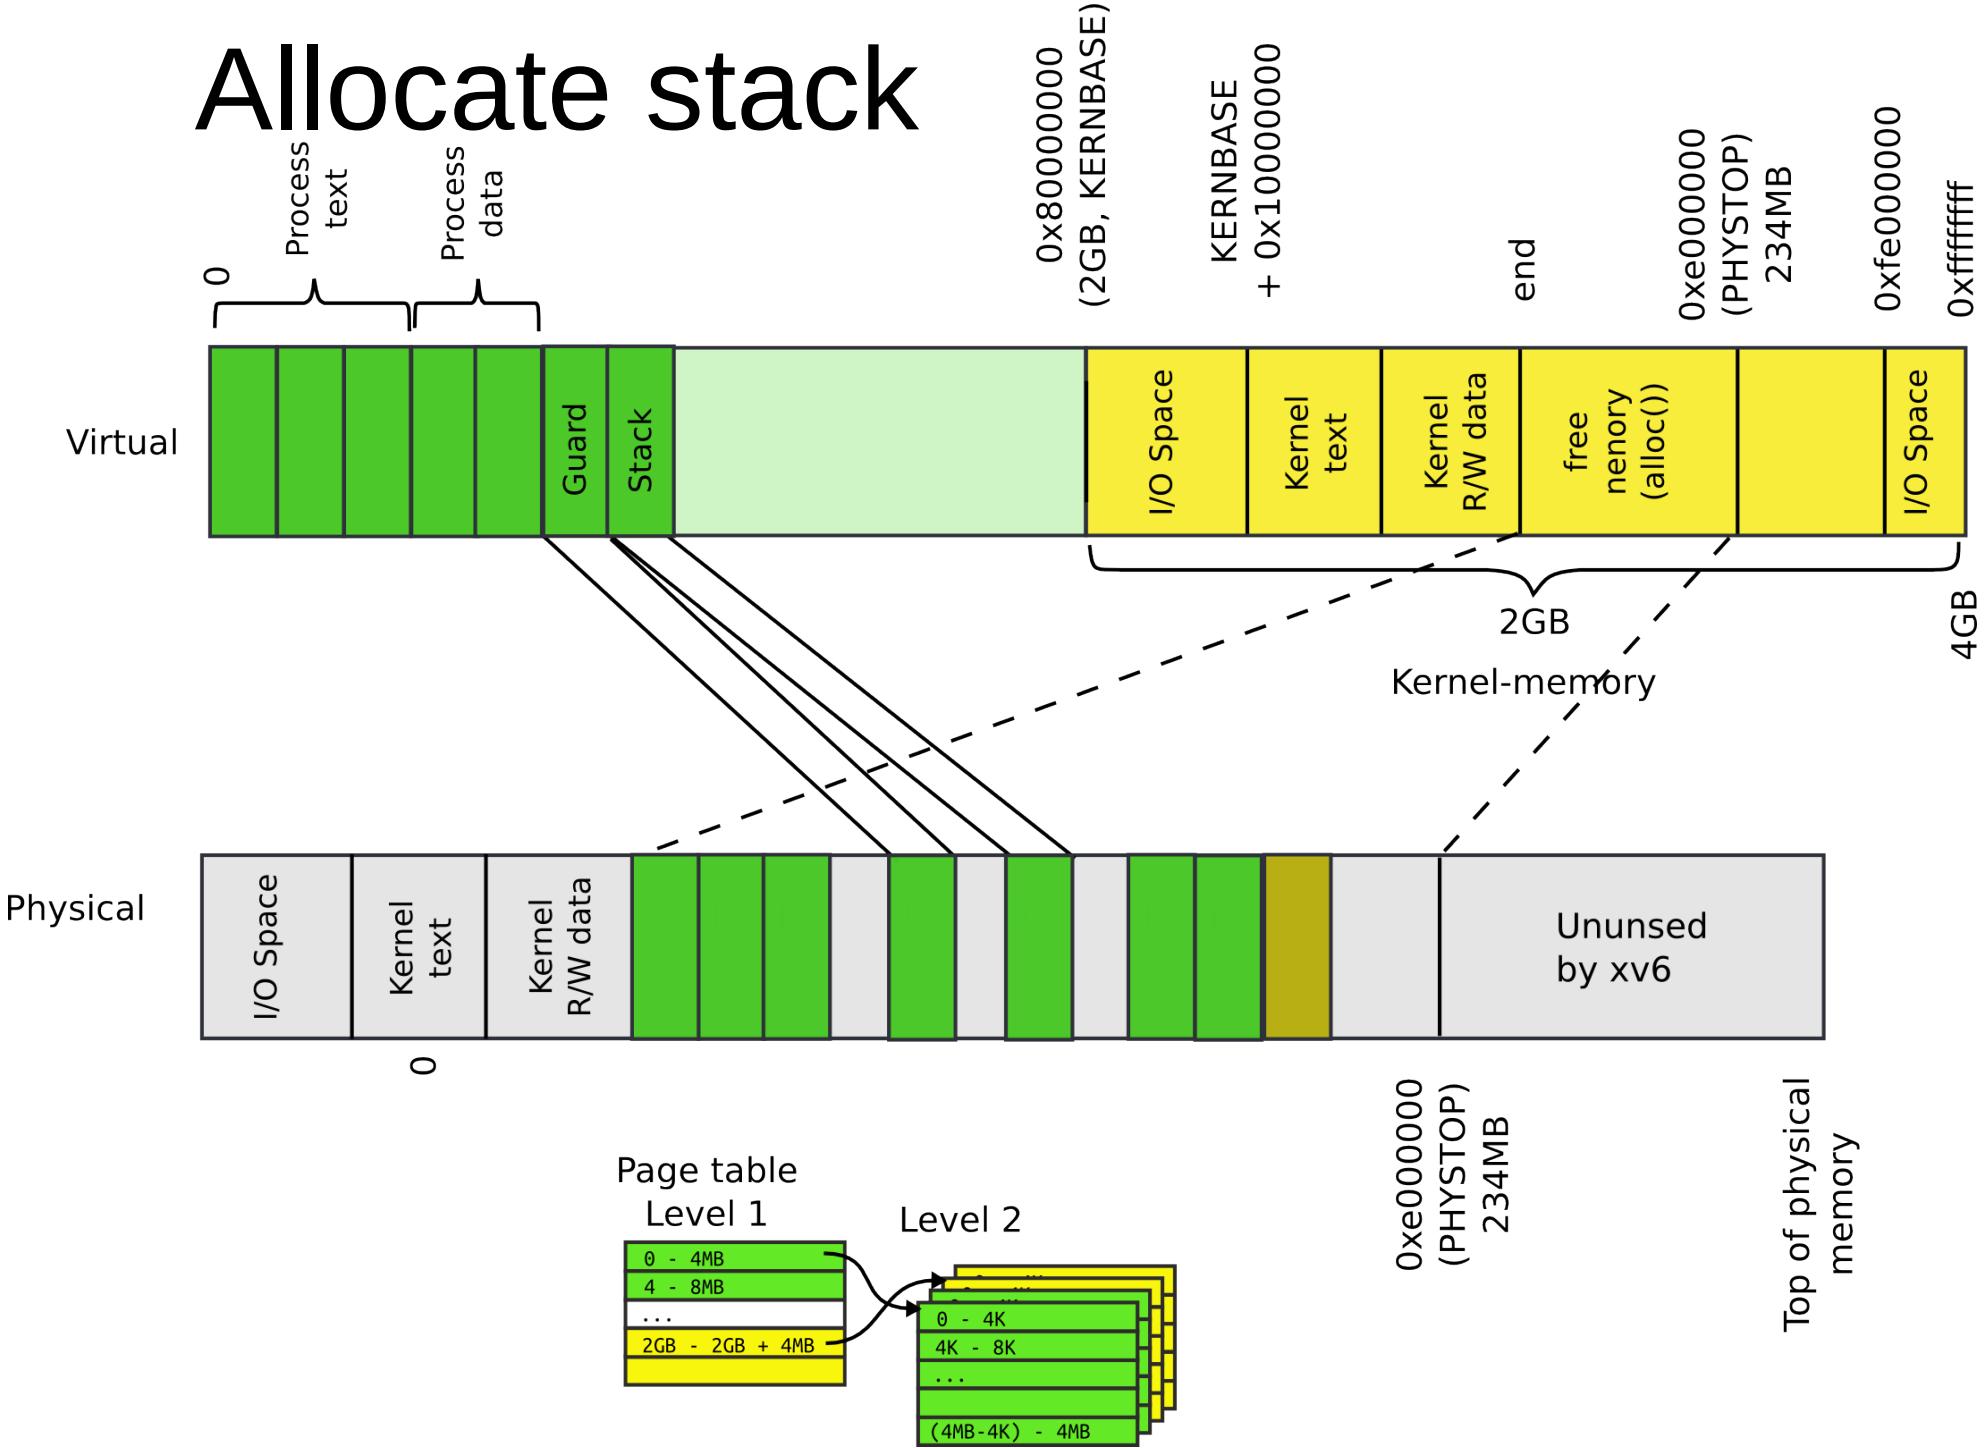

- Allocate a page

```
1918 loaduvm(pde_t *pgdir, char *addr, struct inode *ip, uint offset, uint
sz)
1919 {
...
1925     for(i = 0; i < sz; i += PGSIZE){
1926         if((pte = walkpgdir(pgdir, addr+i, 0)) == 0)
1927             panic("loaduvm: address should exist");
1928         pa = PTE_ADDR(*pte);
1929         if(sz - i < PGSIZE)
1930             n = sz - i;
1931         else
1932             n = PGSIZE;
1933         if(readi(ip, P2V(pa), offset+i, n) != n)
1934             return -1;
1935     }
1936     return 0;
1937 }
```

Load program into memory

- Read the page from disk

Allocate stack

exec(): allocate process' stack

- Allocate two pages
 - One will be stack
 - Mark another one as inaccessible

```
6361     sz = PGROUNDUP(sz);  
  
6362     if((sz = allocuvm(pgdир, sz, sz + 2*PGSIZE)) == 0)  
6363         goto bad;  
  
6364     clearpteу(pgdир, (char*)(sz - 2*PGSIZE));  
6365     sp = sz;
```

```
6367 // Push argument strings, prepare rest of stack in ustack.  
6368 for(argc = 0; argv[argc]; argc++) {  
...  
6371     sp = (sp - (strlen(argv[argc]) + 1)) & ~3;  
6372     if(copyout(pgdir, sp, argv[argc], strlen(argv[argc]) + 1) < 0)  
6373         goto bad;  
6374     ustack[3+argc] = sp;  
6375 }  
6376 ustack[3+argc] = 0;  
6377  
6378 ustack[0] = 0xffffffff; // fake return PC  
6379 ustack[1] = argc;  
6380 ustack[2] = sp - (argc+1)*4; // argv pointer  
6381  
6382 sp -= (3+argc+1) * 4;  
6383 if(copyout(pgdir, sp, ustack, (3+argc+1)*4) < 0)  
6384 goto bad;
```

Push program arguments on the stack

Remember arguments to main()?

- `int main(int argc, char **argv);`
- If you run
 - `./program hello world`
- Then:
 - argc would be 3.
 - argv[0] would be `"./program"`.
 - argv[1] would be `"hello"`.
 - argv[2] would be `"world"`.

Arguments to main() are passed on the stack

- Copy argument strings at the top of the stack
 - One at a time
- Record pointers to them in ustack
 - Which will be an argument list (argv list)

Switch page tables

- Switch page tables
- Deallocate old page table

6398 switchuvm(proc);

6399 freevm(oldpgdir);

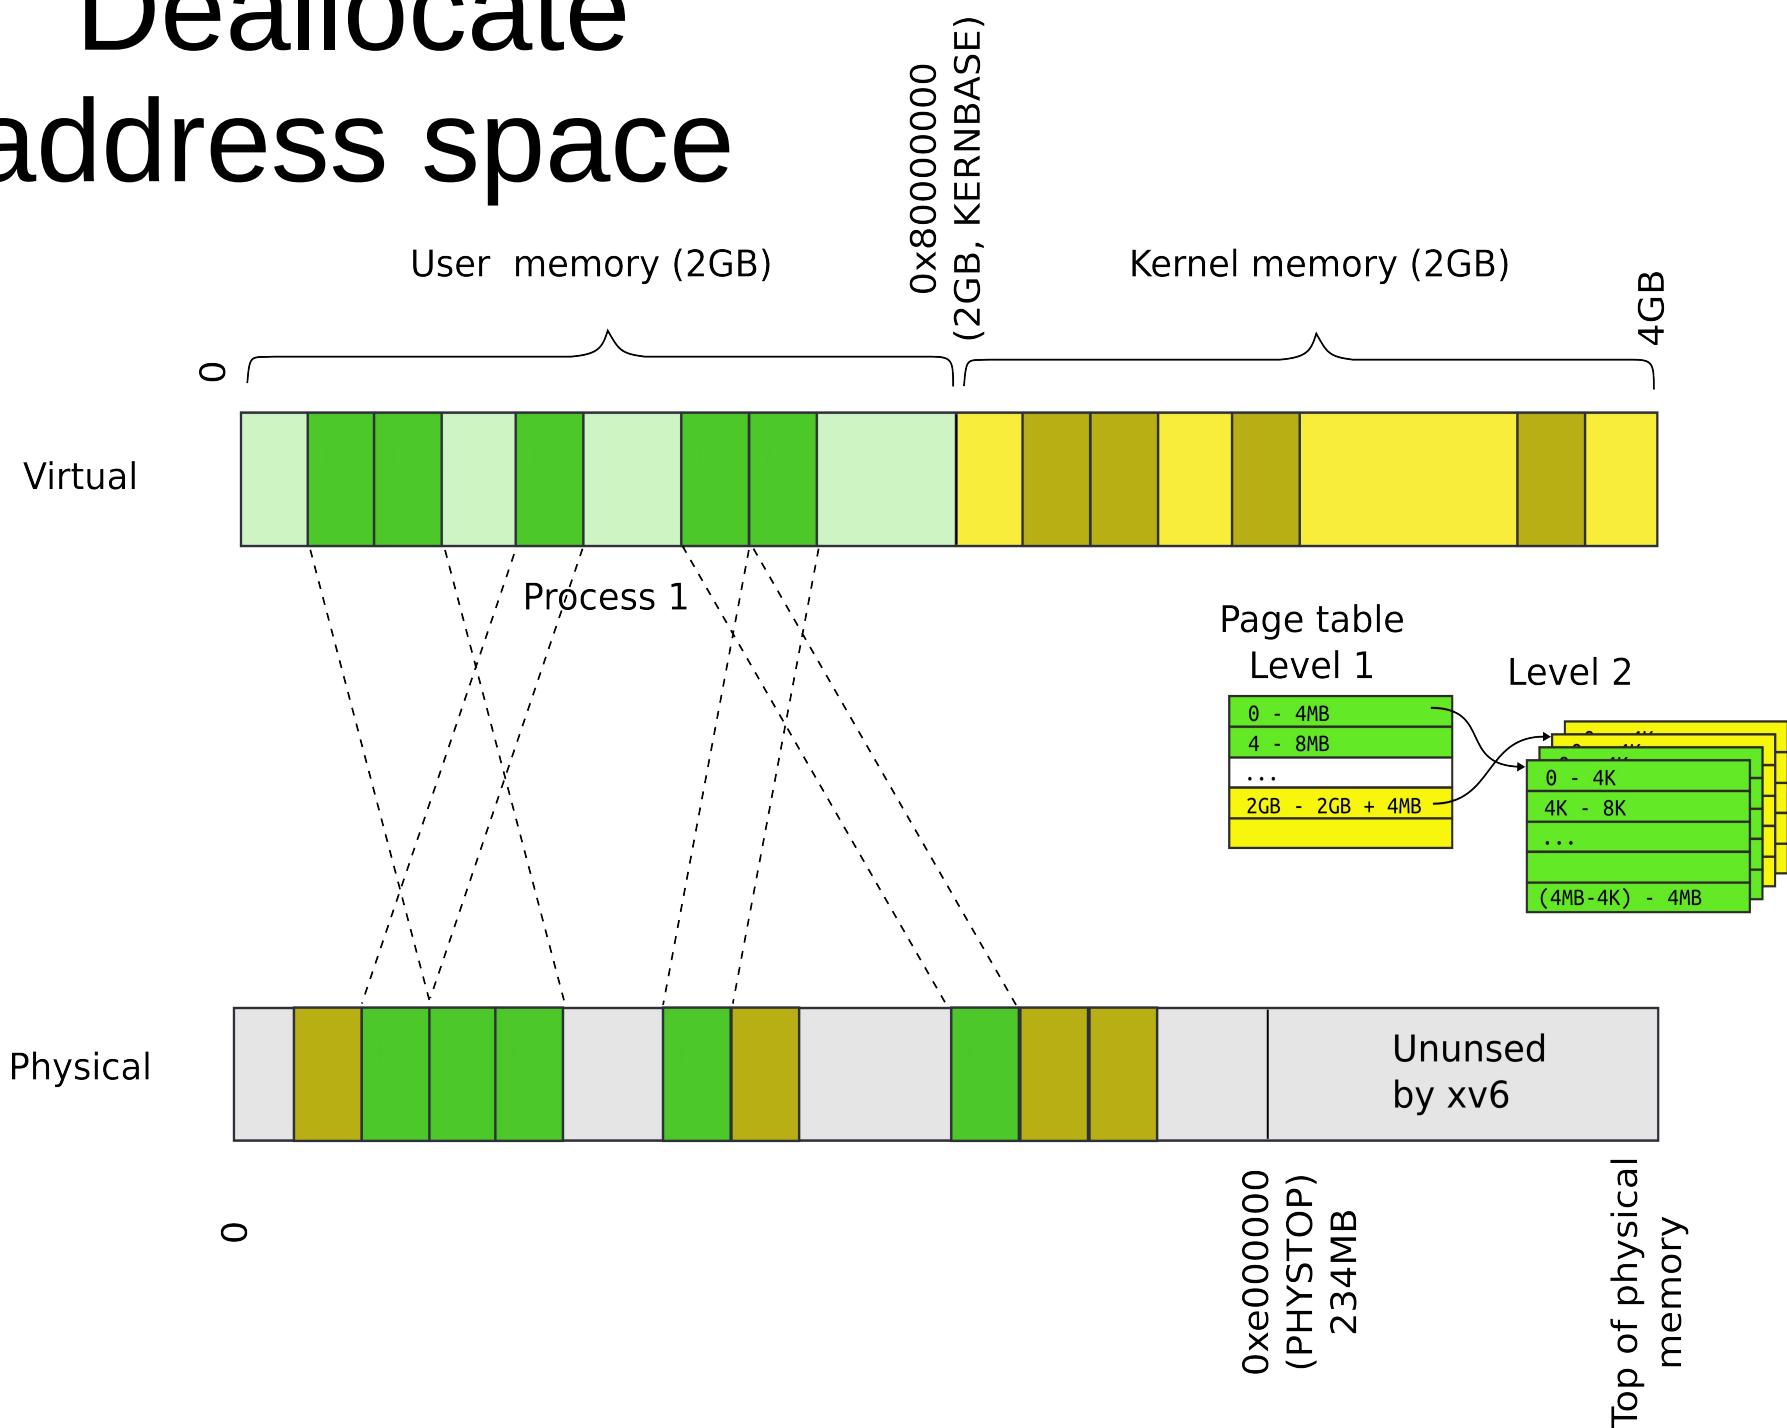

6400 return 0;

Wait... which page table we are
deallocating?

Wait... which page table we are deallocated?

- Remember exec() replaces content of an already existing process
 - That process had a page table
 - We have to deallocate it

Deallocate address space

Outline: deallocate process address space

- Walk the page table
 - Deallocate all pages mapped by the page table
- Deallocate pages that contain Level 2 of the page-table
- Deallocate page directory

```
2015 freevm(pde_t *pgdir)
2016 {
2017     uint i;
2018
2019     if(pgdir == 0)
2020         panic("freevm: no pgdir");
2021     deallocuvm(pgdir, KERNBASE, 0);
2022     for(i = 0; i < NPDENTRIES; i++){
2023         if(pgdir[i] & PTE_P){
2024             char * v = P2V(PTE_ADDR(pgdir[i]));
2025             kfree(v);
2026         }
2027     }
2028     kfree((char*)pgdir);
2029 }
```

Deallocate user
address space

```
1987 deallocuvm(pde_t *pgdir, uint oldsz, uint newsz)
1988 {
...
1995     a = PGROUNDUP(newsz);
1996     for(; a < oldsz; a += PGSIZE){
1997         pte = walkpgdir(pgdir, (char*)a, 0);
1998         if(!pte)
1999             a += (NPTENTRIES - 1) * PGSIZE;
2000         else if((*pte & PTE_P) != 0){
2001             pa = PTE_ADDR(*pte);
2002             if(pa == 0)
2003                 panic("kfree");
2004             char *v = P2V(pa);
2005             kfree(v);
2006             *pte = 0;
2007         }
2008     }
2009     return newsz;
2010 }
```

Walk page table and
get pte

```
1987 deallocuvm(pde_t *pgdir, uint oldsz, uint newsz)
1988 {
...
1995     a = PGROUNDUP(newsz);
1996     for(; a < oldsz; a += PGSIZE){
1997         pte = walkpgdir(pgdir, (char*)a, 0);
1998         if(!pte)
1999             a += (NPTENTRIES - 1) * PGSIZE;
2000         else if((*pte & PTE_P) != 0){
2001             pa = PTE_ADDR(*pte);
2002             if(pa == 0)
2003                 panic("kfree");
2004             char *v = P2V(pa);
2005             kfree(v);
2006             *pte = 0;
2007         }
2008     }
2009     return newsz;
2010 }
```

Deallocate a page

Deallocate Level 2

```
2015 freevm(pde_t *pgdir)
2016 {
2017     uint i;
2018
2019     if(pgdir == 0)
2020         panic("freevm: no pgdir");
2021     deallocuvm(pgdir, KERNBASE, 0);
2022     for(i = 0; i < NPDENTRIES; i++){
2023         if(pgdir[i] & PTE_P){
2024             char * v = P2V(PTE_ADDR(pgdir[i]));
2025             kfree(v);
2026         }
2027     }
2028     kfree((char*)pgdir);
2029 }
```

Recap

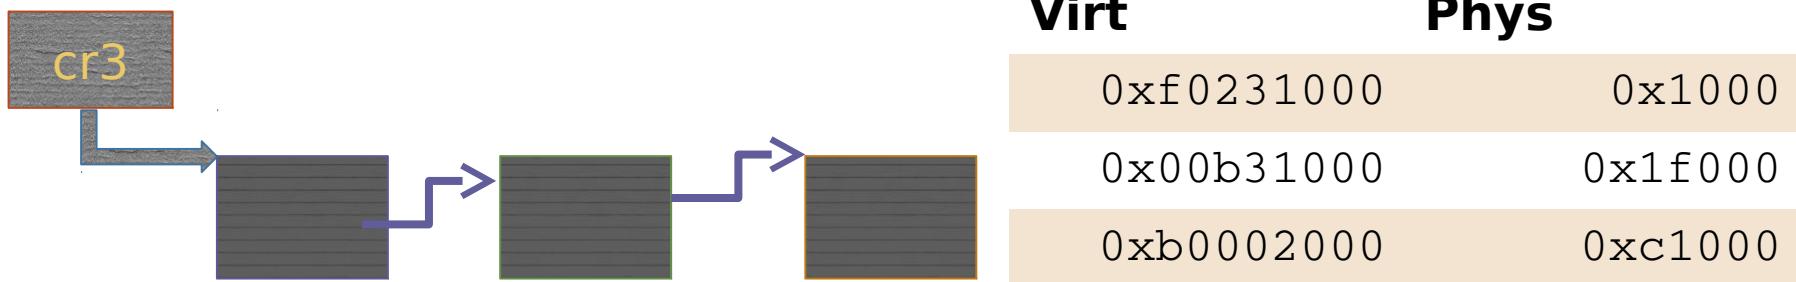

- We know how exec works!
- We can create new processes

Thank you!

Backup

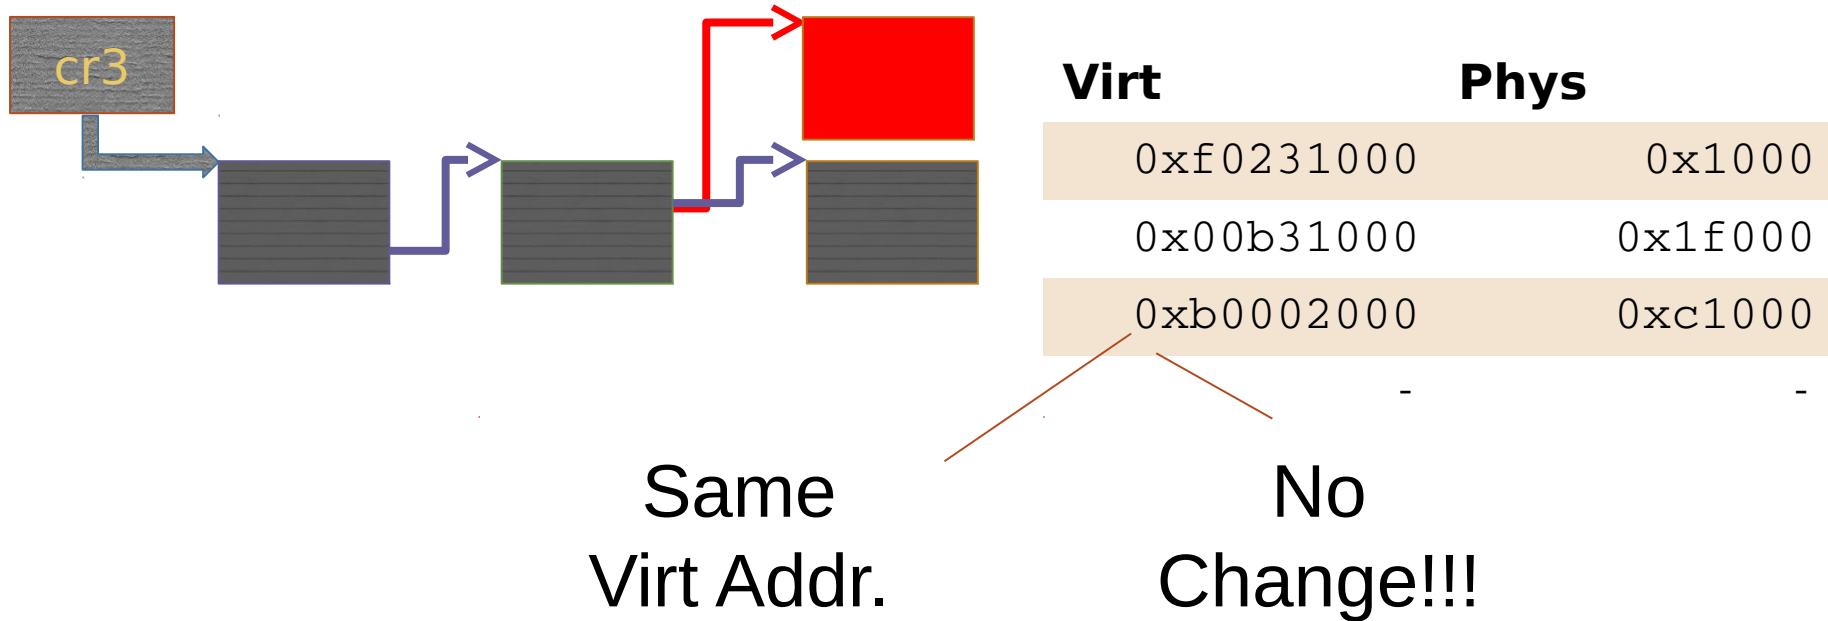

TLB

- CPU caches results of page table walks
 - In translation lookaside buffer (TLB)
- Walking page table is slow
 - Each memory access is 150-200 cycles on modern hardware
 - L3 cache access is 40 cycles

TLB

- TLB is a cache (in CPU)
 - It is not coherent with memory
 - If page table entry is changes, TLB remains the same and is out of sync

Invalidating TLB

- After every page table update, OS needs to manually invalidate cached values
- Modern CPUs have “tagged TLBs”,
 - Each TLB entry has a “tag” – identifier of a process
 - No need to flush TLBs on context switch
- On Intel this mechanism is called
 - Process-Context Identifiers (PCIDs)
